Instructions for use - Azure Dental Implant System (C+E) / Azure 粘膜植牙系統 (C-system)

1. Product description.
   The implant system process described with titanium is surgically inserted into the upper and lower jawbones and serves as a replacement for lost, broken, and/or decayed teeth. The implant is made of titanium with approximately 135°C for 10 minutes, which is then used for sterilisation.

2. Product of purpose.
   The Azure Dental Implant System is designed for use in implant denture surgery. It makes the natural tooth not only restored inserted into the upper and lower jawbones. The implant system is made of the same materials as used in the upper and lower jawbones. The implant system is used for connecting the abutment to the implant.

3. Dimension for use.
   The implant system is used for dental implant dentures in cases where there is an insufficient bone amount. The implant system can be used in cases where there is insufficient bone amount.

4. General Precaution.
   The implant system is designed for use in cases where there is an insufficient bone amount. The implant system is used for connecting the abutment to the implant.

5. Warning.
   Using the Azure Dental Implant System denture implant work is effective. Since the surgical techniques involved in the implant denture operation are highly skilled and very complex, the selection of appropriate patients and treatment methods can cause implant failure. However, it is important to understand that dental implant surgery is not a replacement for lost, broken, and/or decayed teeth. The implant system is made of the same materials as used in the upper and lower jawbones. The implant system is used for connecting the abutment to the implant.

6. Contraindication.
   Contraindications include those having, but are not limited to:
   - Allergy to medications
   - Allergy to dental implants
   - Poor oral hygiene
   - Poor overall health
   - Poor dexterity
